

Beeswax Candle kit Instructions

Working Area ☆

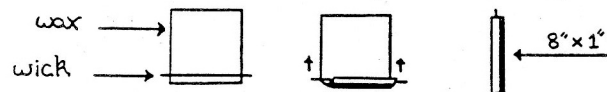

room. A smooth work surface is best, in your kitchen or work -

You may want to cover the surface with newspaper to protect it. • Make sure the wax is at room temperature

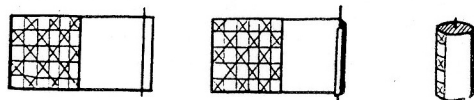

protect it. • Make sure the wax is at room temperature. • When cutting the wax, use a sharp knife or single edged - razor blade and cut against a metal or wooden ruler.

Cylinder Candles ✱

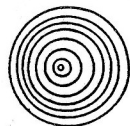

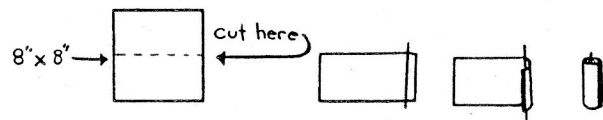

① Use a single sheet (or more) of beeswax. Lay a piece - of wick along the bottom of your sheet, cutting it a little - longer than the wax. ②. Fold a small flap up and over to tightly cover the wick. Press firmly down, then roll up the sheet.

If using more than one piece, butt one sheet up to the other, and you will get a fatter candle.

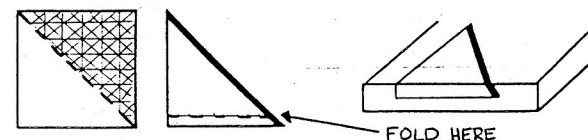

For a shorter candle, cut your 8" x 8" piece in half and start at the short end when rolling.

Tapered Candles ✱

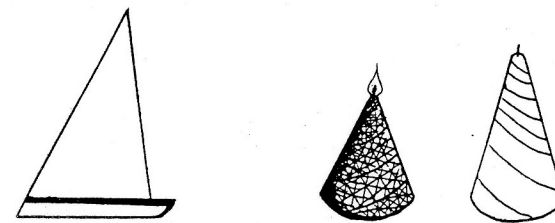

Take your ruler and lay it from corner to corner - and cut. Place sheet so that a small piece hangs over the table or board edge, and bend the flap down.

Now that youve formed a groove to put your wick in, turn the sheet over, place the wick in the slot, and while keeping it tight, press down the wax. Start rolling tightly, keeping it even; when finished rolling, candle is made!

For a shorter candle, roll up from the short end of the sheet, placing the wick as you did for the larger-candle.

Enjoy
